METHOD AND APPARATUS FOR PROVIDING GROUP INTERACTION VIA COMMUNICATIONS NETWORKS

ABSTRACT

A system for communicating between members of a group is disclosed which includes a communications interface transmitting at least one of voice, video and text communications from an originating member to at least one destination member and a graphical communication flow module graphically depicting to each member of the group a representation of each of the members of the group. The graphical communication flow module graphically depicts communication flows from the communications interface such that members may view communications flows independent of the content of the voice, video and text communications transmitted by the communications interface.
